INTRODUCTION

1.0 INTRODUCTION

1.1 Purpose

The primary objective of this report is to provide stormwater calculations and supporting documentation for the design of the surface water management system, which will serve the proposed WILDWOOD WAREHOUSE COMPLEX project.

The existing site consists of 7.183 acres of vacant land. The site is cleared with grass vegetation and a few medium trees. The project area is 2.941 acres (see construction plans).

The proposed improvements consist of the construction of 2-10,000 s.f. Warehouse Buildings, with paved parking facility and a stormwater management system. As shown in the attached set of construction plans and stormwater calculations, the project was designed to meet both, Sumter County & Southwest Florida Water Management District stormwater criteria.

A wet detention pond has been designed to attenuate the stormwater runoff for the 25 YR/24 HR Storm and provide water quality treatment. The pond discharges to an existing wetland onsite through a control structure and spreader swale system. The control structure features a Skimming Device to prevent oil and floating debris from leaving the site.

1.2 Project location

The WILDWOOD WAREHOUSE COMPLEX site is located on the east side of West Gulf Atlantic Highway (SR44) and just south of Kilgore St. (CR44A). The Project is within SECTION 2, TOWNSHIP 19 SOUTH, RANGE 22 EAST, SUMTER COUNTY, FLORIDA

Please see attached location map, Figure 1, which can be found under Appendix A.

PRE-DEVELOPMENT CONDITIONS

2.0 PRE-DEVELOPMENT CONDITIONS

2.1 Existing Conditions

The existing site consists of 7.183 acres of vacant land. The site is cleared with grass vegetation and a few medium trees. The project area is 2.941 acres (see construction plans).

2.2 Soil Information

The soils encountered on the project, as per the “Sumter County Soil Survey”, are (36) Floridana mucky fine sand, depressional, and (46) Ft. Green fine sand, bouldery subsurface

The following is a table that clearly quantifies the amount of each soil encountered on the project and the hydrologic group to which they belong to.

For a figure reflecting the extent of the soils please refer to Appendix A, **Figures 3 & 4**.

Table 1 – Existing Soils

Soil Symbol	Soil Name	Acreage	Soil %	Hydrologic Group
36	Floridana mucky fine sand, depressional	0.510	17.34	D
46	Ft. Green fine sand, bouldery subsurface	2.431	82.66	D
TOTAL		2.941	100.00	

2.3 Curve Number

Curve Numbers (CN), an empirical description for infiltration and rainfall excess, were determined for both the pre development and post development conditions. The CN values were obtained from the Soil Conservation Service Technical Release 55 (SCS TR-55), June 1986, using a general hydrologic classification of the soils encountered in accordance with the Soil Survey of Sumter County, Florida.

The following is a table that reflects the CN based on the existing conditions.

Table 2 – Existing Curve Number

Soil Symbol	Cover Type	Acreage	Acreage %	CN	~CN
36	Floridana Mucky Fine Sand, depressional	0.510	17.34	89	15.43
46	Ft. Green Fine Sand, bouldery subsurface	2.431	82.66	89	73.57
TOTAL		2.941	100.00%	89.00	

2.4 Time of Concentration

In addition to the drainage areas and CN values, the time of concentration is also utilized within the Santa Barbara Urban Hydrograph Methodology (SBUH) to determine stormwater runoff rates. Times of concentration are computed by determining the path of longest travel time within each of the delineated sub-basins. Flow velocities are estimated from land slopes and land cover conditions.

The time of concentration values were developed from the information and methodologies outlined in the SCS TR-55 documentation. For the pre-development, the time of concentration was equal to 0.57 hr or 34.2 min. Please refer to Appendix B for the computation of the time of concentration.

2.5 Pre-Development Summary

Project Acreage – 2.941 acres

Curve Number (CN) – 89

Time of Concentration (TC) – 34.2 minutes

POST-DEVELOPMENT CONDITIONS

POST-DEVELOPMENT CONDITIONS

3.1 Proposed Conditions

The proposed improvements consist of the construction of a two (1) story building (10,000 Square Foot Warehouse) with paved/grass parking facility and a stormwater management system, as shown in the attached set of construction plans and stormwater calculations, the project was designed to meet both, Sumter County & Southwest Florida Water Management District stormwater criteria.

3.2 Curve Number

The CN values were obtained from the Soil Conservation Service Technical Release 55 (SCS TR-55), June 1986, using a general hydrologic classification of the soils encountered in accordance with the Soil Survey of Orange County, Florida. The following is a table that reflects the CN based on the existing conditions.

Table 3 – Proposed Development Curve Number

Conditions	Acreage	Acreage %	CN	~CN
Prop. Building	0.459	15.61%	98.000	15.30
Prop. Pavement/Sidewalks	0.509	17.31%	98.000	16.96
Gravel areas	0.000	0.00%	91.000	0.00
Pond (water)	0.308	10.47%	98.000	10.26
Pond (grass)	0.205	6.97%	89.000	6.20
Green areas	1.460	49.64%	89.000	44.18
	2.941	100%		92.90

IMPERVIOUS 1.276 43.39%

PERVIOUS 1.665 56.61%

* For treatment purposes

3.3 Time of Concentration

The time of concentration values were developed from the information and methodologies outlined in the SCS TR-55 documentation. For the post-development, the time of concentration was equal to 10.00 min.

3.4 Post-Development Summary

Project Acreage – 2.941 acres

Curve Number (CN) – 92.90

Time of Concentration (TC) – 10 minutes

TREATMENT VOLUME CRITERIA

4.0 TREATMENT VOLUME CRITERIA

4.1 Stormwater Treatment Criteria

I. Compute the half inch of Runoff plus half inch over developed project:

$$V_r = (1.0 \text{ in.}) (2.941 \text{ ac.}) / 12 \text{ in./ft.} = 0.245 \text{ ac.-ft.}$$

4.2 Pond Stage-Storage Computation

The purpose of the proposed pond is to catch and hold the runoff generated by the post-development improvements and to provide adequate pollution abatement volume as well as peak discharge rate attenuation. Table 4 below provides the Stage – Storage Relationship for the Pond above the control elevation of 49.30.

Table 4 – Pond Stage/Storage Relationship

<u>Stage (ft.-msl.)</u>	<u>Area (acres)</u>	<u>Ave. Area (acres)</u>	<u>H (ft.)</u>	<u>Storage (ac.-ft.)</u>	<u>Accum. Storage (ac.-ft.)</u>
49.70	0.298				0.000
50.40	0.345	0.321	0.70	0.225	0.225
51.00	0.373	0.359	0.60	0.215	0.440
51.50	0.397	0.385	0.50	0.192	0.633
52.00	0.420	0.409	0.50	0.204	0.837
52.60	0.449	0.435	0.60	0.261	1.098

4.3 Water Quality Storage Elevation

A bleed-down control device is being proposed at the pond at elevation 49.70 (ft.-msl.) to achieve the treatment required volume computed of 0.245 ac.-ft.. The minimum required weir elevation was calculated at elevation 50.46.

4.4 Permanent Pool Volume

A requirement for wet detention ponds is that the storage capacity of the permanent pool is enough to provide a 14-day residence during the wet season.

The following calculations will provide a 14 day residence time:

$$\text{Runoff coefficient} = \frac{(0.968 \text{ ac.})(0.9) + (0.308 \text{ ac.})(1.0) + (1.665 \text{ ac.})(0.2)}{2.941 \text{ ac.}} = 0.514$$

$$14\text{-day residence time during the wet season} = 14 \text{ days} / 122 \text{ days}$$

$$\text{Minimum permanent pool volume} = \frac{(2.941 \text{ ac.})(0.514)(31.04 \text{ in.})(14 \text{ days} / 122 \text{ days})}{12 \text{ in.} / \text{ft.}} = 0.449 \text{ ac. - ft.}$$

4.5 Permanent Pool Stage Storage

To demonstrate that the proposed pond is able to provide the required permanent pool volume, a stage storage relationship was developed.

The following table reflects the stage-storage relationship for the pond below the control elevation of 49.70. The Pond provides more than the minimum required permanent pool volume.

Table 5 – Permanent Pool Stage/Storage Relationship

<u>Stage (ft.-msl.)</u>	<u>Area (acres)</u>	<u>Ave. Area (acres)</u>	<u>H (ft.)</u>	<u>Storage (ac.-ft.)</u>	<u>Accum. Storage (ac.-ft.)</u>
41.70	0.096				0.000
		0.140	6.00	0.840	
47.70	0.184				0.840
		0.241	2.00	0.482	
49.70	0.298				1.322

POND RECOVERY ANALYSIS

4.6 Drawdown Orifice Calculations:

* The drawdown requirement is that no more than half the treatment volume should be discharged in the first 60 hours after the storm event. A popular means of meeting this requirement is to use an orifice bleed-down device. Calculations are as follows:

$$Q = CA (2gh)^{1/2}$$
$$A = Q / C (2gh)^{1/2}$$

where: Q = rate of discharge (cfs)

A = orifice area (sq. ft.)

g = gravitational constant (32.2 ft./sec²)

h = depth of water above the flow line (center) of the orifice

C = orifice coefficient (usually assumed = 0.6)

therefore:

$$Q = (0.245 \text{ ac.-ft.} \times 43560 \text{ ft.}^2 / \text{ac.}) / 2 \times 1/60 \text{ hrs.} \times 1\text{hr} / 3600 \text{ sec.} = 0.025 \text{ cfs}$$
$$h = (h_1 - h_2)$$

where: h_1 = initial stage

h_2 = stage when half the treatment volume has been released

$$h = (50.46 - 50.11) = 0.35 \text{ ft.}$$

therefore: $A = 0.025 \text{ cfs} / (0.6 [(2)(32.2 \text{ ft.}/\text{sec.}^2)(0.35 \text{ ft.})]^{1/2})$

$$A = 0.009 \text{ ft.}^2$$

The diameter (D) of an orifice = $(4A / 3.1416)^{1/2}$

therefore: $D = [(4)(0.009 \text{ ft.}^2) / 3.1416]^{1/2}$

$$D = 0.106 \text{ ft.} \quad \text{or} \quad 1.3 \text{ ins.} \quad \text{----- use a 1.5 inch orifice.}$$

RESULTS

5.0 RESULTS

5.1 Results

After inputting the pre/post-development information into Advanced Interconnected Channel and Pond Routing (AdICPR), IEC was able to determine the peak discharge rate and maximum stage elevations for the different Storm Events for the proposed retention pond.

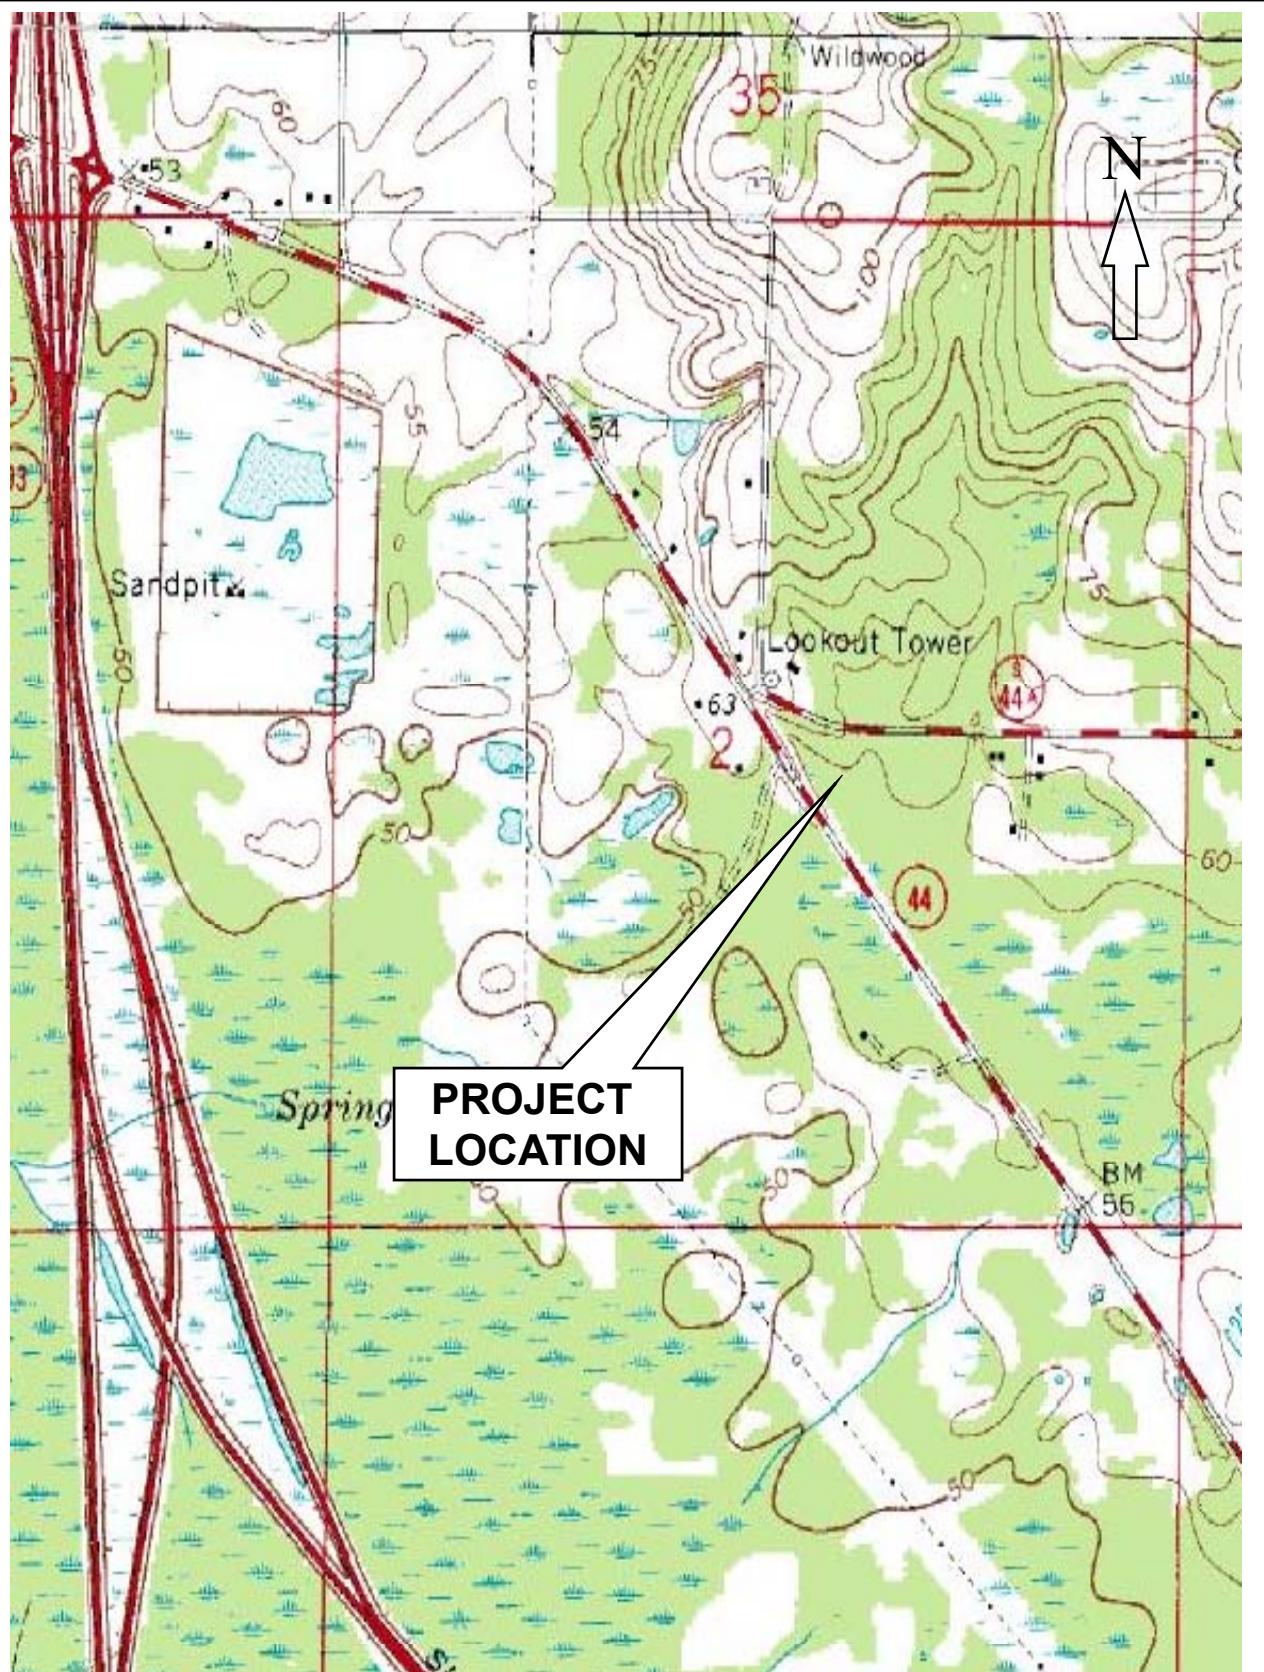

Table 6 summarizes the pre/post-development conditions and pond stages.

Table 6 - Node Maximum Conditions

Storm Event	Pre-Dev. Peak Discharge (cfs)	Post-Dev. Peak Discharge (cfs)	Peak Stage Elevation [ft]
10YR24HR	8.25	7.59	51.37
25YR24HR	9.63	8.17	51.58
100YR24HR	12.13	9.13	51.96
